

Photosensitizing Medication List

MANY MEDICATIONS, TOPICAL SOLUTIONS AND EVEN SOME FOODS CAN CAUSE THE SKIN TO BURN OR BREAK OUT IN A RASH WHEN EXPOSED TO ULTRAVIOLET LIGHT. THE CONSEQUENCES CAN RANGE FROM ITCHINESS TO AN UNCOMFORTABLE RASH AND BURNS.

IT IS CRITICAL THAT EVERY SALON OWNER POST A CHART OF PHOTOSENSITIVE MEDICATIONS AND AGENTS IN A CONSPICUOUS LOCATION. IF A CLIENT IS TAKING A MEDICATION THAT ISN'T LISTED, HE OR SHE SHOULD CONSULT WITH A PHYSICIAN OR PHARMACIST BEFORE BEING EXPOSED TO ULTRAVIOLET LIGHT—INDOORS OR OUTDOORS.

The most common photosensitizing materials are listed on the following pages. This is not a list of every material that could have photosensitizing effects. Before using the list, you should be aware of the following:

- NOT all individuals who use or take these medications will experience a photosensitive reaction. Also, an individual who experiences a photosensitive reaction on one occasion will NOT necessarily experience it again or every time.
- A medication will NOT cause the same degree of skin reaction in all individuals.

- Brand names of products should be considered only as examples; they do NOT represent all names under which the generic product may be sold.

The following list was prepared by Jerome I. Levine, M.S., R.Ph., of the U.S. Food and Drug Administration. The list was published under the title "Medications That Increase Sensitivity To Light: A 1990 Listing." The FDA has confirmed this list to be the most recent. The mention of commercial products, their sources or their use in connection with material reported herein is not to be construed as either an actual or implied endorsement of such products by the Department of Health and Human Services.

Products

A few products also are known to make the skin more sensitive to UV light, such as halogenated salicylanilides and related compounds used as antibacterial agents in first-aid creams, acne preparations and deodorant soaps. Perfumes and colognes containing furocoumarins, compounds from natural products such as plants and fruits, have natural oils that can sensitize the skin to sunlight. Musk ambrette is used in some aftershaves and colognes and also has been found to cause skin reaction to UV light.

Some makeup products contain the following dyes, which can cause a reaction under UV light, another reason to make sure skin is clean before tanning. Certain food products also contain the following dyes.

Acridine	Fluorescin	Toluidine Blue
Anthracene	Methylene Blue, Violet, Orange and Red	Trypafavin
Cadmium Sulfide	Neutral Red	Trypan Blue
Eosin (found in lipstick)	Rose Bengal	
Erythrosin

Health Conditions

If your clients have any of the following conditions they should not tan without written consent from their physicians.
(It is very unlikely that any doctor will permit tanning under these circumstances.)

Albinism	Lung Tuberculosis	Polymorphous Light Eruption	Rosacea	Varix
Atinie Prurigo	Lupus Erythematosum	Porphria	Solar Urticaria	Vitiligo
Dermatomycitis	Melasma	Related Allergies	Sun Poisoning	Xeroderma Pigmentosum
Lichen Rubber	Photoallergic Eczema			

Note: Items with an asterisk (*) are more likely to cause photosensitivity reactions. Overall, the drugs listed above cause reactions in less than 1% of patients. Tell clients who get an unusual "sunburn" or allergic or eczematous reaction in skin areas exposed to light to let their physician or pharmacist know about the problem and to discontinue exposure to UV radiation. Photosensitivity data from Pharmacist's Letter.
